## TECHNICAL INFORMATION

### MATERIAL COMPATABILITY

The information presented in this data chart is intended as a guide to the chemical resistance to materials used in the manufacture of Jomar valves.

Many factors which will influence corrosion rating such as: temperature fluctuations, concentrations and aeration of fluids, high velocity or abrasions in the fluid steam, etc. have to be taken into account. The physical properties of material are affected differently by each corrosive media and is sometimes necessary to sacrifice valves in one property to gain a maximum valve in another property.

An "A" rating should be given to internal moving parts, in direct contact with the media. In some cases a "B" rating can be given to body material in direct contact with media, when the corrosion rate is not one to cause any serious problems.

#### Ratings Explanation

A = Excellent / B = Good / C = Poor / D = Do not use

Blank = No information available.

Ratings are based on media at room temperatures, unless otherwise specified.

We would advise that ratings given to be used as a guide to the selection of valve materials and not as an absolute recommendation.

Although most of the suggested ratings in this corrosion chart are based on experience, Jomar cannot accept responsibility for problems arising from use of this data.

We do however recommend that in critical applications, tests be conducted to verify the rating.
